

# Executive summary by Uyen Tran

The scottyab/rootbeer project is a crucial project for our company, which has been active for around 350 weeks and spans from 2015 to 2021. The project has 32 unique authors and 177 unique source files. Based on our data analysis, I'm confident that our team has identified the top contributors to the project, and we recommend keeping Scott Alexander-Bown, Matthew Rollings, Andy Barber, matthew, Frieder Bluemle, mat, Daniel Kutik as they are the backbone of this project. The data shows that these authors have been the most active, and they have the highest recent commitments.

We have also identified inactive authors who have contributed to the project with less than three commits in the last 100 weeks. Our team recommends eliminating these authors such as Ali Waseem and BIOCATCH\Leon, Karabchevsky, Deepak PK, Fi5t, Harsh Mahajan, Ivan Vlasov, Jamie Cruwys, LeonKarabchevsky, Prempal Singh, Roberto Gonzalez, Shanmugasanthosh, Slim Namouchi, Stefan M, Grubeli, zhqcqpt. However, we want to review their contributions before making any final decision. Furthermore, we recommend focusing on Java language, as most of the files are in this language. The most committed file is the RootBeer.java file, with 53 commits, and Matthew Rollings contributed to this file the most.

In conclusion, our recommendations will help us to achieve our goals for the scottyab/rootbeer project. By keeping the top contributors, focusing on Java language, and reviewing the contributions of inactive authors, we can ensure the success of this project. which has most of the dots.

My top helpful git commands are git log, git diff, and git branch. Git log shows the overall project tree, git diff displays file differences, and git branch creates a new branch from the master.
